**PRESENTATION OF THE PROPOSAL**

The present social and environmental management proposal presented by INDESC SAS, regarding the formulation and implementation of Projects for the Reduction of Emissions from Deforestation and Avoided Degradation, for its acronym in English PDD REDD+ in tropical humid forest ecosystems (low hills plain type of the Pacific and flood-prone areas or mangroves), in various basins of the Colombian Pacific and the Amazon, its purpose is to carry out all the steps required both in the social dimension, as well as in the technical and legal aspects to comply with all the required actions. to take the projects to the sales phase of verified carbon units (VCUs) in the referenced areas.

The sections of this proposal focus on describing general aspects concerning REDD+ mitigation strategies, the certification standards available for the voluntary market, as well as each of the phases that comprise the implementation of a REDD+ project, its main characteristics and associated activities, and potential funding sources.

In this way, a roadmap is proposed that in its execution will allow us to fully identify the information, management and activities needs for the efficient fulfillment of each of these phases with a view to a successful implementation of the design or formulation strategy. of the PDD REDD+, raised.

**OVERVIEW OF REDD+ PROJECTS**

**REDD+ Mechanism Definition**

The Reduction of Emissions from Deforestation and Forest Degradation (REDD+) is a mechanism whose objective is to recognize the ecosystem service of carbon storage provided by forests, and which is aimed at encouraging the replacement of practices that generate degradation processes and deforestation of forest covers by others that allow the reduction of Greenhouse Gas emissions associated with these changes in land use<sup>1</sup>.

It has been estimated that tropical countries can reduce about 1.5 Gt C of emissions via avoiding deforestation over 10 years, and thus generate billions of dollars for conservation and climate change mitigation if an effective REDD mechanism exists. . In this sense, it is particularly interesting to remember that, in addition, standing forests provide a large number of benefits and services to local and global communities, in addition to carbon capture and storage, since they are home to the largest number of species on the planet. , a source of timber and non-timber products, regulate the local climate and are key in the provision of food, medicine, drinking water, as well as recreational and spiritual benefits for hundreds of millions of people. The potential of the REDD+ mechanism has a wide spectrum of options. While REDD+ addresses Climate Change, it has the potential to support rural poverty reduction by providing incentives to forest-based communities, it can also help, in a complementary way, to conserve biodiversity and promote the sustainability of vital services. systemic echoes.

**REDD+ Mechanism Characteristics**

Table 1 presents the main characteristics of a REDD+ project, including the benefits associated with the implementation of this type of mechanism.

1 Carbon finance. Viewed at: <http://finanzascarbono.org/nuevos-mecanismos-de-mitigacion/redd/que-es-redd/>

Table 1. Characteristics of a REDD+ Mechanism.

Characteristics	Descripción
Objetivo	Reduce emissions from deforestation and degradation, regardless of whether the risk of release is immediate or future.
Actividades Elegibles	Reduction of deforestation and degradation, conservation of carbon stocks, sustainable management of humid and floodable forests; as well as the improvement of forest reserves.
Beneficios en la Reducción de GEI	Al destinar los recursos directamente a evitar la deforestación y degradación que se podría dar a futuro, se generan beneficios de reducción a más largo plazo, o incluso para zonas donde no hay riesgos, casi nulos.
Beneficios Ambientales	By allocating resources directly to avoiding deforestation and degradation that could occur in the future, reduction benefits are generated in the longer term, or even for areas where there are no risks, almost zero
Beneficios Sociales	In addition to those associated with REDD, REDD+ includes recognition of ancestral activities for the conservation of forest ecosystems and of practices that benefit both the maintenance and improvement of carbon stocks, as well as sustainable forest management practices.
Requerimientos Técnicos	Methodologies for monitoring forest cover and its degradation.
	Methodologies for accounting for carbon associated with forests.
	Definition of alternative sustainable activities that replace the activities that generate deforestation/degradation
	Identification of sustainable forest management practices
	Forest reserve improvement methodologies
Mecanismo Financiero	It can be developed with both markets and funds, and could be intermediate in size between the other options.
